Audio prototype [video]

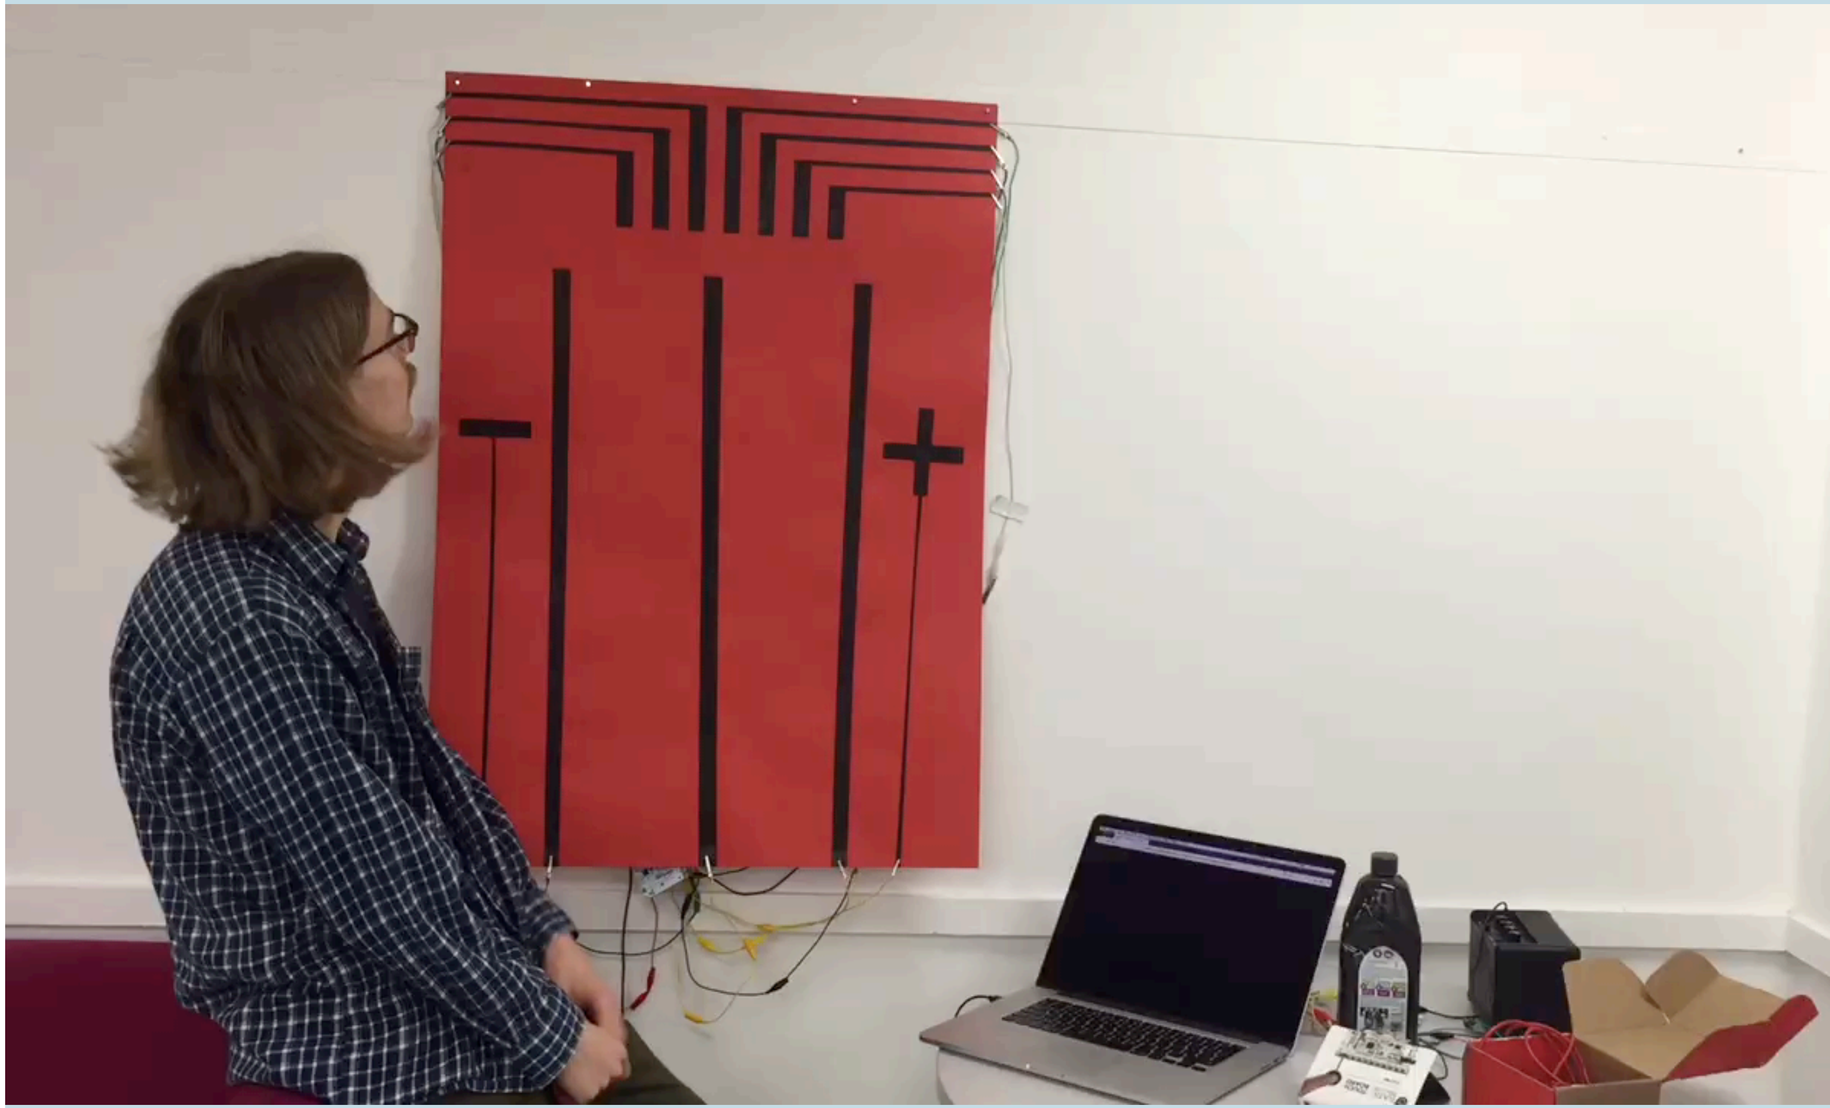

Implementing further functionality to the piece would be key to making a more engage-able end product. Using sound along side the visuals would add another dimension to the piece to further immerse users. The 7 new lines at the top of the prototype play a single MP3 file from the start on key down. On key up the file is stoped and set back to the start; doing so produces a simple midi controller. Individual channels from a greater song can now be added to allow people to build their own music.

Editing
[video]

Our event to capture video was a great success. Having done tests and pre prepped storey boards on hand made for a smooth shooting process on the night. The video shown left is one of three complete videos captured from the night, representing one of our three individuals. Exposure of the raw video was boosted to lighten up shots. More brightening can always be done if we find that our projection method is not displaying how we intend to. These videos can now be placed in our working prototype to test visibility.
