Lights and camera test [video]

A few days prior to the event we set up our desired lighting for the night. This then allowed us to test the camera to make sure that come the evening of the event, we could be confident that we would capture the footage as we had previously envisioned. A TV was present in the room allowing us to show visuals if we wanted but decided in these tests that the light thrown by the TV would be too bright, even at its lowest setting. TV visuals as a result were not used on the night.

A few days prior to the event we set up our desired lighting for the night. This then allowed us to test the camera to make sure that come the evening of the event, we could be confident that we would capture the footage as we had previously envisioned. A TV was present in the room allowing us to show visuals if we wanted but decided in these tests that the light thrown by the TV would be too bright, even at its lowest setting. TV visuals as a result were not used on the night.

Audio prototype [video]

Implementing further functionality to the piece would be key to making a more engage-able end product. Using sound along side the visuals would add another dimension to the piece to further immerse users. The 7 new lines at the top of the prototype play a single MP3 file from the start on key down. On key up the file is stoped and set back to the start; doing so produces a simple midi controller. Individual channels from a greater song can now be added to allow people to build their own music.
