Concept sketch

This sketch quickly describes our vision of the piece, allowing for communication with stakeholders to be more effective. Here you can see an individual interacting with three touch points (A, B and C) via a Makey Makes which would then show video in the spaces to the side of the poster (W, X, Y and Z). Projection was initially proposed to be the output method for the video but after discussions with technicians we came to the conclusion that projection was possibly not the best option but to use monitors instead. Testing will show if this is a viable.

Software

[video]

The video (shown left) shows the initial browser run software that would power the interaction through a Makey Makey. Upon each key down the software shows a one of three videos that is bound to the arrow keys. Once the key is lifted the video returns to its hidden state. Individuals interacting with the poster would have to have one finger on conductive ink for the video to be displayed.
