Projection test [video]

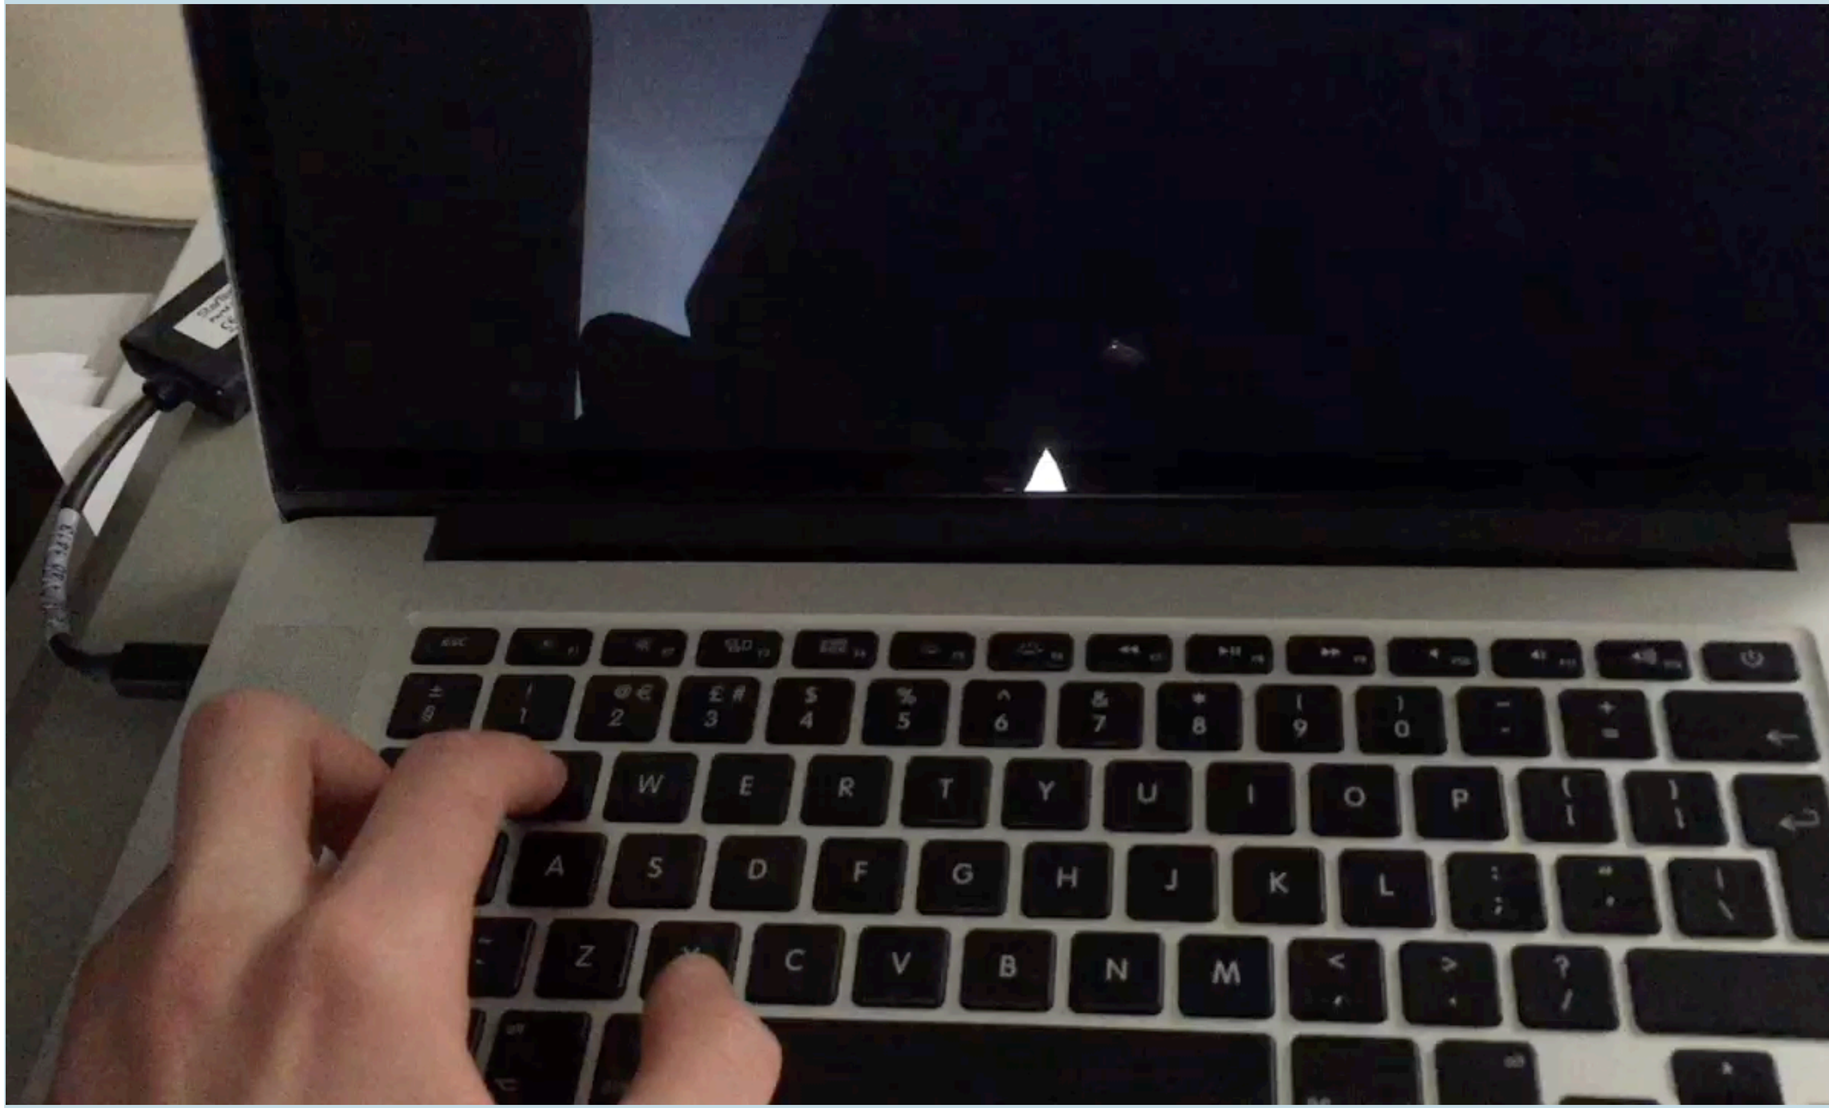

With all the videos finished and in the software, we can move forward with display testing. The video shown right illustrates our projection test. The test itself showed us that the room will have to be at a much darker level for our current visuals to be effective. Methods to do this for the show will be researched before hand and again tested. We also wish to do further testing for where we project in relation to the interface with the factor of individuals standing in front and impeding the projection.

The test itself showed us that the room will have to be at a much darker level for our current visuals to be effective. Methods to do this for the show will be researched before hand and again tested. We also wish to do further testing for where we project in relation to the interface with the factor of individuals standing in front and impeding the projection.

Music production [video]

Using Ableton we produced our own music in line with the projects themes. The music was built to be played in sections and looped to fit with our current prototype. Exporting the finished track in its individual channels allows for each one to be spliced into the software allowing for them to be played individually or as a whole. Furthermore, this allows for users to manipulate the track and make it their own within the boundaries of the 6 channels.
